

Marathon everRun[®] VM For Citrix XenServer

Virtualization without downtime

Virtualization drives cost saving and efficiency, but it also consolidates risks to applications. A single physical component failure can affect many applications running in virtual servers.

Using everRun[®] VM for Citrix XenServer, you can extend server virtualization to a broad range of mission-critical applications without worrying about downtime.

everRun VM integrates Citrix XenServer's "bare-metal" performance with everRun's innovative technology. It proactively prevents downtime through redundant systems and monitoring while creating a single, always available application instance in virtual server environments.

RUN MISSION-CRITICAL APPLICATIONS WITHOUT DOWNTIME

Using everRun VM, you can move mission-critical applications to virtual servers without worrying about consolidating your risk.

everRun VM proactively prevents application downtime, with redundancy spanning physical and virtual servers, storage and networks. Real-time validation and automated I/O redirection keep your applications running even through component or system-wide failures.

everRun has been designed and tested to work with the latest versions of Citrix XenServer:

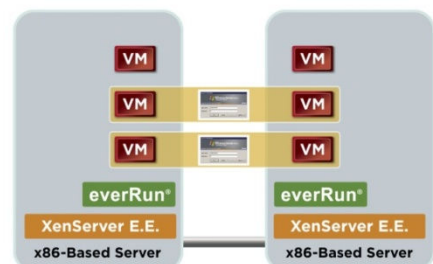

- Enterprise-Class, Cloud-Proven, Free XenServer
- Essentials for XenServer

NEVER LOSE ESSENTIAL DATA

If you have applications that cannot lose a byte of data, then you need everRun. It automatically mirrors application data to create a consistent, identical version that can be separated physically from the original. Data remains available even if a disk device, network or entire server fails.

SIMPLIFY YOUR IT ENVIRONMENT

You don't need a team of virtualization and availability experts or a big budget to eliminate downtime in your virtualized environment. Simply point everRun VM to the VM you want to protect, and everRun's setup wizard does the rest.

WORLDWIDE HEADQUARTERS

Marathon Technologies Corporation
295 Foster Street, Littleton, MA 01460
Tel 1.800.884.6425 / 1.978.489.1100

Fax +44(0) 1344.706.242
Email: emea@marathontechnologies.com
Web: www.marathontechnologies.com

You can fully deploy XenServer and everRun from bare metal in 30 minutes or less.

everRun VM then automatically monitors and responds to failures for critical applications, helping you deliver superior service levels with less IT effort. It alerts you when it detects potential problems that could lead to future faults.

Otherwise, it practically runs itself, which is why it is so successful in branch and remote offices, and in disaster recovery sites without IT personnel on hand.

ENJOY PEACE OF MIND

To get the full benefits of server virtualization, you want to be able to move most or all of your applications to virtual servers. And with everRun VM, you can provide each VM with the appropriate level of availability, automatically.

everRun VM supports multiple availability levels, fault tolerance and full system-level fault tolerance for applications with the most stringent needs.

With everRun automatically enforcing the right availability levels across *all* of your Windows applications and virtual machines, you can relax and enjoy the benefits of server virtualization.

ADD DISASTER RESILIENCE, EASILY

Add everRun 2G SplitSite[®] to stretch your resilient application environment across wide distances, so that a site-wide problem or outage won't bring your applications down.

"everRun is a game changing availability offering that allows XenServer customers to tailor the level of availability per virtual machine."

- Simon Crosby, Citrix, CTO Virtualization & Management Division
